

What 20 Clinicians Told Us About AI in Healthcare

Early insight from practising UK clinicians

Key Insights

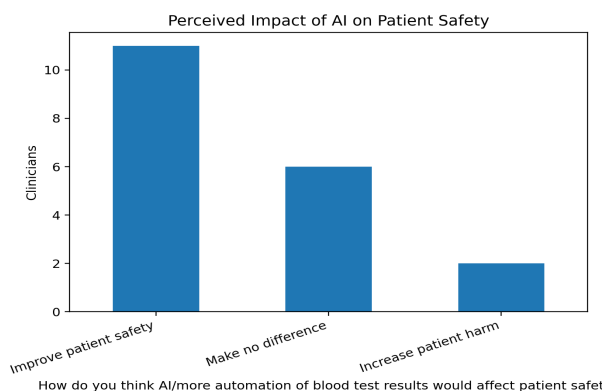

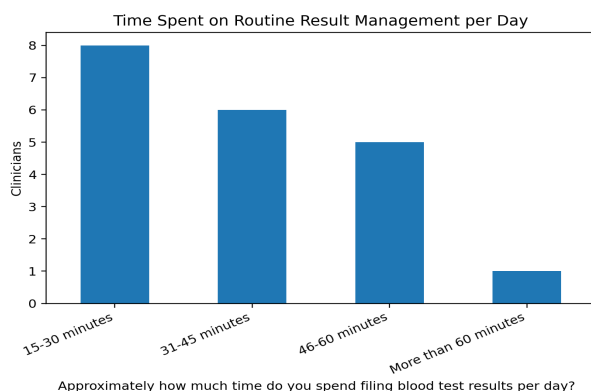

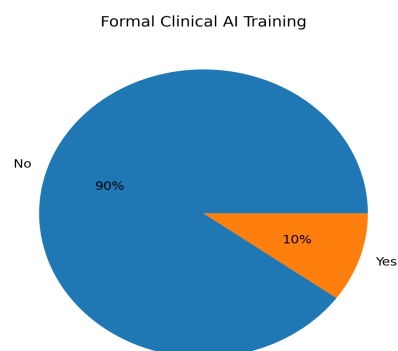

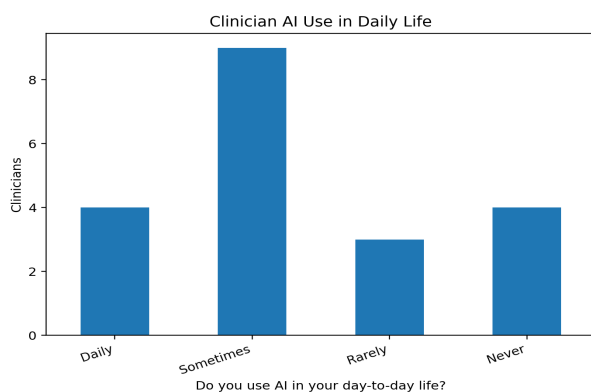

Clinicians are already experimenting with AI tools outside formal clinical systems.

Formal training in clinical AI remains extremely limited.

Routine administrative clinical tasks continue to consume significant clinician time.

Clinicians appear open to AI if safety safeguards and oversight are clear.

We asked practising UK clinicians about their experience with artificial intelligence. 80% reported using AI tools in everyday life, with 20% using them daily. However, only 10% reported receiving any formal training in AI within clinical practice. 90% believe clinicians spend too much time on routine result management tasks.

Clinicians are already experimenting with AI tools in everyday work. The greater barriers to adoption appear to be governance, safety expectations and integration into existing workflows rather than lack of interest.

If you are building a product or service in health tech and would value access to practising clinicians for insight, feedback or early validation work, please get in touch. We regularly speak with clinicians across our network and are happy to collaborate with teams exploring new healthcare technologies.

AI in the Clinic: The Gap Between Personal Use and Professional Training

**THE READINESS GAP:
PERSONAL vs. PROFESSIONAL**

**FORMAL TRAINING
& TRUST**

80%

report using AI in
day-to-day life but

20% report
use
every day

While personal usage is high,
only 20% of clinicians use
these tools daily.

**TRUST
OVER
TECH**

Adoption depends
on trust, oversight
and workflow fit
rather than actual
technical capability.

90%

report no AI training
for clinical practice

The **vast majority of
practitioners** lack
professional clinical
training.
