

Building a Health Tech Product? Speak to Clinicians Early.

As practising doctors we help health tech teams pressure-test ideas, understand how products fit real clinical workflows, and identify potential barriers to adoption.

If you are developing a product or service in health tech and would value perspective from practising clinicians, we would be happy to speak with you.

Clinician Insight Case Study

We surveyed 20 doctors working in general practice (including GPs and GP trainees) to understand their views on artificial intelligence in healthcare.

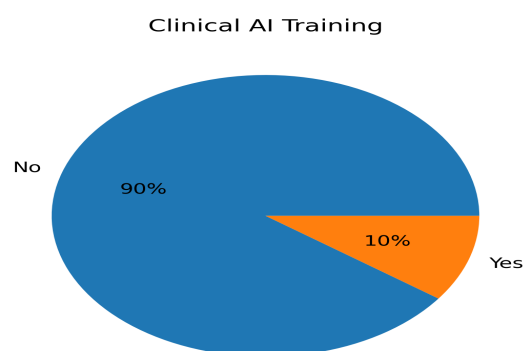

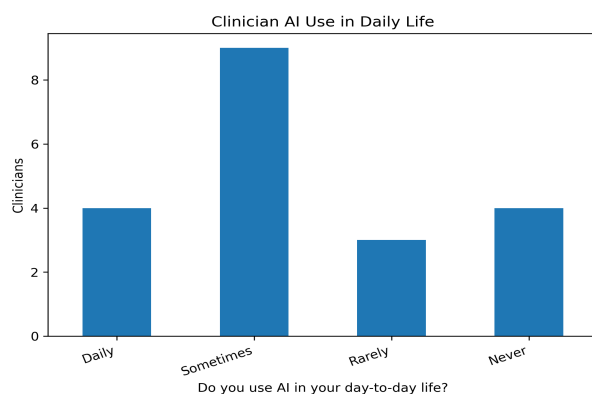

Key Findings

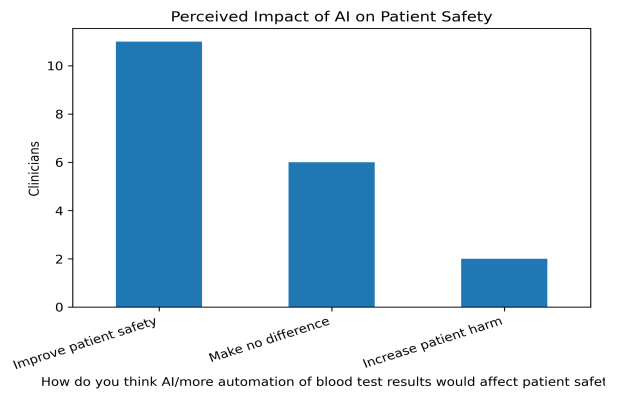

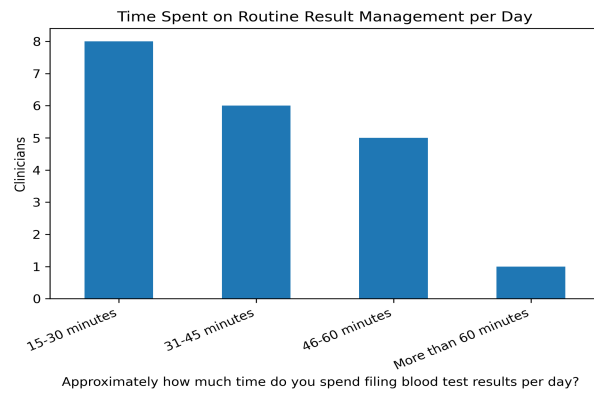

Many clinicians are already experimenting with AI tools in everyday life.

Clinical AI training has not kept pace with adoption.

Routine administrative clinical tasks consume significant clinician time.

Clinicians appear open to AI if safeguards and oversight are clear.

These responses suggest clinicians are not fundamentally resistant to AI. Many are already experimenting with these tools in everyday work. The greater barriers to adoption appear to be governance, safety expectations and integration into existing clinical workflows.

AI in the Clinic: The Gap Between Personal Use and Professional Training

**THE READINESS GAP:
PERSONAL vs. PROFESSIONAL**

**FORMAL TRAINING
& TRUST**

80%

report using AI in day-to-day life but

20% report use every day

While personal usage is high, only 20% of clinicians use these tools daily.

**TRUST
OVER
TECH**

Adoption depends on trust, oversight and workflow fit rather than actual technical capability.

90%

report no AI training for clinical practice

The vast majority of practitioners lack professional clinical training.
